Jack,

I bought a 32 foot Class C motorhome last year. After a lot of research and study on various forms of aerodynamic improvements I bought a set of Airtabs. My primary concern was ease of driving and stability.

Installation was easy and fast. The first time I took the RV out after installation I was amazed at how easy it was to drive. I hoped it was not just wishful thinking and a good day so I have held my conclusions till this year. I have put over 10,000 miles on the RV with the Airtabs in all kinds of weather from heavy rain, sun and cross winds. I have driven divided highways and two lane 65 MPH state roads. All I can say is you UNDERATE the Airtabs. There is no noticeable "push" or any disturbance when passing a semi going in the opposite direction on a two lane road while we both are going 60 MPH plus. WOW. Semi passing me in the same direction on the highway is a non-event. I recommended Airtabs to my brother-in-law for his class A motorhome and he has the same results. In fact, he has "sold" at least two more owners on his vacation trip this year.

I placed Airtabs ahead of my rear wheels also. They seem to be acting like skirts and keeping the wheels clean.
